1 GATE 2021 (ME-SET1)PROBLEM.33

Customers arrive at a shop according to Poisson distribution with a mean of 10 customers/hour. The manager notes that no customer arrives for the first 3 minutes after the shop opens. The probability that a customer arrives within the next 3 minutes is

2 Solution

Given, 10 customers arrive in a time interval of an hour $\iff \frac{1}{2}$ customers arrive in a time interval of 3 minutes.

$$\lambda = \frac{1}{2} \tag{2.0.1}$$

Let X denotes the number of customers in first 3 minutes,Y denotes the number of customers in second 3 minutes. according to poisson distribution,

$$\Pr(X = x) = e^{-\lambda}\frac{\lambda^x}{x!} \tag{2.0.2}$$

using (2.0.1) in (2.0.2),

$$\Pr(X = x) = e^{-\frac{1}{2}}\frac{(\frac{1}{2})^x}{x!} \tag{2.0.3}$$

we need to find the probability that a customer arrives within the next 3 minutes given that no customer arrives for the first 3 minutes after the shop opens,which can also be written as,

$$\Pr(Y \neq 0|X = 0) = \frac{\Pr(Y \neq 0, X = 0)}{\Pr(X = 0)} \tag{2.0.4}$$

TABLE 0: Probability distribution for values of X and Y

	P(X)	P(Y)
0	$e^{-\frac{1}{2}}$	$e^{-\frac{1}{2}}$
1	$\frac{e^{-\frac{1}{2}}}{2}$	$\frac{e^{-\frac{1}{2}}}{2}$

As the arrival of customers in second 3 minutes does not depend on the arrival of customers in first 3 minutes, X and Y are independent,

$$\Pr(Y \neq 0|X = 0) = \frac{\Pr(Y \neq 0)\Pr(X = 0)}{\Pr(X = 0)} \tag{2.0.5}$$

$$= \Pr(Y \neq 0) \tag{2.0.6}$$

$$= 1 - \Pr(Y = 0) \tag{2.0.7}$$

using (2.0.3),

$$\Pr(Y \neq 0|X = 0) = 1 - e^{-\frac{1}{2}} \tag{2.0.8}$$

$$= 0.3935 \tag{2.0.9}$$
